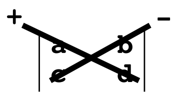
06-0: **Determinant**

- The Determinant of a 2x2 matrix is defined as:

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - cb$$



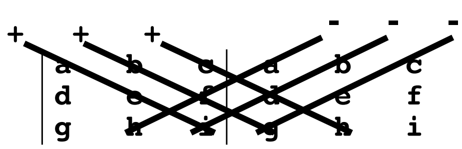
06-1: **Determinant**

- We can define the determinant for a 3x3 matrix in terms of the determinants of 2x2 submatrices (minors)

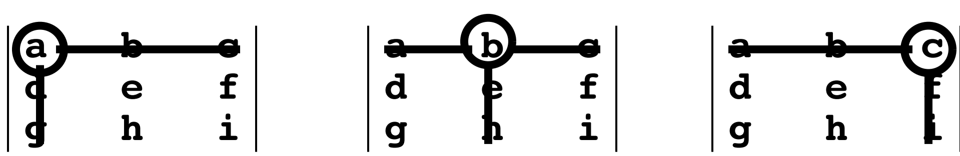
$$\begin{aligned}\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} &= a\begin{vmatrix} e & f \\ h & i \end{vmatrix} - b\begin{vmatrix} d & f \\ g & i \end{vmatrix} + c\begin{vmatrix} d & e \\ g & h \end{vmatrix} \\ &= a(ei - hf) - b(di - gf) + c(dh - ge) \\ &= aei + bfg + cdh - afh - bdi - ceg\end{aligned}$$

06-2: **Determinant**

$$\begin{aligned}\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} &= a\begin{vmatrix} e & f \\ h & i \end{vmatrix} - b\begin{vmatrix} d & f \\ g & i \end{vmatrix} + c\begin{vmatrix} d & e \\ g & h \end{vmatrix} \\ &= a(ei - hf) - b(di - gf) + c(dh - ge) \\ &= aei + bfg + cdh - afh - bdi - ceg\end{aligned}$$



$$\begin{vmatrix} + & - & + \\ - & + & - \\ + & - & + \end{vmatrix}$$



$$a\begin{vmatrix} e & f \\ h & i \end{vmatrix} \quad - \quad b\begin{vmatrix} d & f \\ g & i \end{vmatrix} \quad + \quad c\begin{vmatrix} d & e \\ g & h \end{vmatrix}$$

06-3: **Determinant**

06-4:

$$\begin{vmatrix} + & - & + \\ - & + & - \\ + & - & + \end{vmatrix}$$

$$\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} \qquad \begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} \qquad \begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix}$$

$$-d\begin{vmatrix} b & c \\ h & i \end{vmatrix} + e\begin{vmatrix} a & c \\ g & i \end{vmatrix} - f\begin{vmatrix} a & b \\ g & h \end{vmatrix}$$

Determinant

06-5: **De-**

$$\begin{vmatrix} + & - & + \\ - & + & - \\ + & - & + \end{vmatrix}$$

$$\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} \qquad \begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} \qquad \begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix}$$

$$g\begin{vmatrix} b & c \\ e & f \end{vmatrix} - h\begin{vmatrix} a & c \\ d & f \end{vmatrix} + i\begin{vmatrix} a & b \\ d & e \end{vmatrix}$$

terminant

06-6: **Deter-**

minant

- We can expand determinants to 4x4 matricies ...

$$\begin{vmatrix} a & b & c & d \\ e & f & g & h \\ i & j & k & l \\ m & n & o & p \end{vmatrix} = a\begin{vmatrix} f & g & h \\ j & k & l \\ n & o & p \end{vmatrix} - b\begin{vmatrix} e & g & h \\ i & k & l \\ m & o & p \end{vmatrix} + c\begin{vmatrix} e & f & h \\ i & j & l \\ m & n & p \end{vmatrix} - d\begin{vmatrix} e & f & g \\ i & j & k \\ m & n & o \end{vmatrix}$$

06-7: **Determinant**

- There are many ways to define / calculate determinants
    - Add all possible permutations
    - Sign is parity of number of inversions

$$\begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = a_1b_2c_3 - a_1b_3c_2 - a_2b_1c_3 + a_2c_3b_1 + a_3b_1c_2 - a_3b_2c_1$$

06-8: **Determinant**

- Determinant properties

- Multiplying a column (or row) by k is the same as multiplying the determinant by k

$$\begin{aligned}\begin{vmatrix} ka & b \\ kc & d \end{vmatrix} &= kad - kcb \\ &= k(ad - cb) \\ &= k\begin{vmatrix} a & b \\ c & d \end{vmatrix}\end{aligned}$$

06-9: **Determinant**

- Determinant properties
  - Multiplying a column (or row) by k is the same as multiplying the determinant by k

$$\begin{aligned}\begin{vmatrix} ka & b & c \\ kd & e & f \\ kg & h & i \end{vmatrix} &= ka\begin{vmatrix} e & f \\ h & i \end{vmatrix} - b\begin{vmatrix} kd & f \\ kg & i \end{vmatrix} + c\begin{vmatrix} kd & e \\ kg & h \end{vmatrix} \\ &= ka\begin{vmatrix} e & f \\ h & i \end{vmatrix} - kb\begin{vmatrix} d & f \\ g & i \end{vmatrix} + kc\begin{vmatrix} d & e \\ g & h \end{vmatrix} \\ &= k\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix}\end{aligned}$$

06-10: **Determinant**

- Determinant properties
  - Swapping two rows (or two colums) of a determinant reverse the sign (but preserves magnitude)

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - cb = -(bc - ad) = -\begin{vmatrix} b & a \\ d & c \end{vmatrix}$$

06-11: **Determinant**

- Determinant properties
  - Swapping two rows (or two colums) of a determinant reverse the sign (but preserves magnitude)

$$\begin{aligned}\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} &= a\begin{vmatrix} e & f \\ h & i \end{vmatrix} - b\begin{vmatrix} d & f \\ g & i \end{vmatrix} + c\begin{vmatrix} d & e \\ g & h \end{vmatrix} \\ &= -\left(-a\begin{vmatrix} e & f \\ h & i \end{vmatrix} + b\begin{vmatrix} d & f \\ g & i \end{vmatrix} + c\begin{vmatrix} e & d \\ h & g \end{vmatrix}\right) \\ &= -\left(b\begin{vmatrix} d & f \\ g & i \end{vmatrix} - a\begin{vmatrix} e & f \\ h & i \end{vmatrix} + c\begin{vmatrix} e & d \\ h & g \end{vmatrix}\right) = -\begin{vmatrix} b & a & c \\ e & d & f \\ h & g & i \end{vmatrix}\end{aligned}$$

06-12: **Determinant**

- Determinant properties
  - Other fun determinant properties
  - Take a “real” math class for more ...

06-13: **Determinant: Geometry**

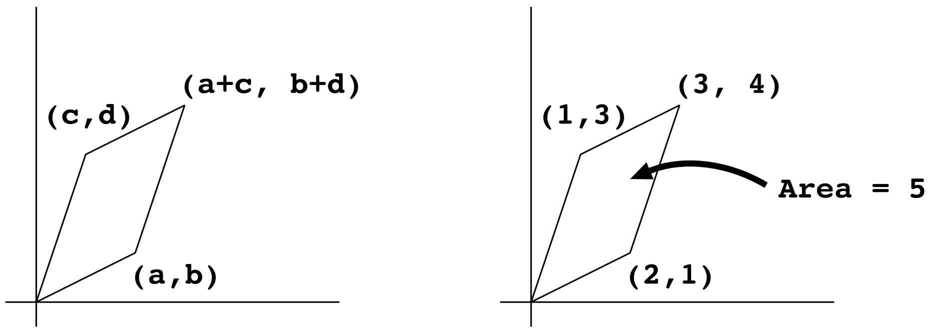
- 2x2 determinant is signed area of parallelogram

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix}$$

Parallelogram: $(0,0), (a,b), (a+c, b+d), (c,d)$

06-14: **Determinant: Geometry**

$$\begin{vmatrix} \mathbf{a} & \mathbf{b} \\ \mathbf{c} & \mathbf{d} \end{vmatrix} \qquad \begin{vmatrix} 2 & 1 \\ 1 & 3 \end{vmatrix} = 6 - 1 = 5$$

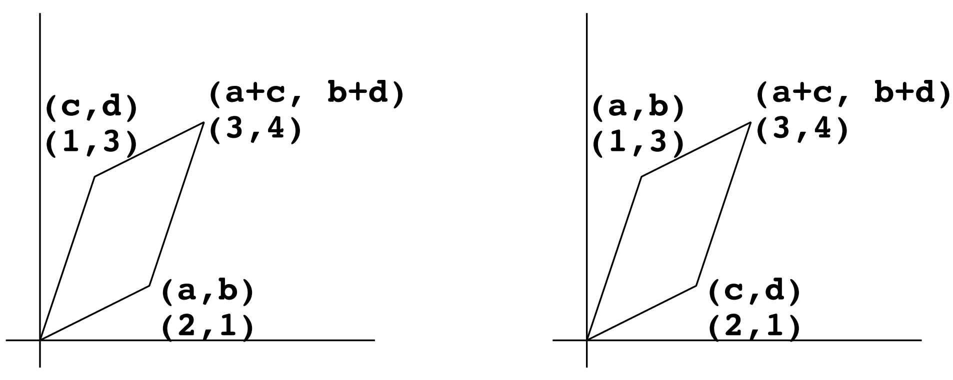


06-15: **Determinant: Geometry**

- *Signed* area
  - If the points $(0,0), (a,b), (a+c, b+d), (c,d)$ go around the parallelogram *counter-clockwise*, the area is positive
  - If the points $(0,0), (a,b), (a+c, b+d), (c,d)$ go around the parallelogram *clockwise*, the area is negative

06-16: **Determinant: Geometry**

$$\begin{vmatrix} \mathbf{a} & \mathbf{b} \\ \mathbf{c} & \mathbf{d} \end{vmatrix} = \begin{vmatrix} 2 & 1 \\ 1 & 3 \end{vmatrix} \qquad \begin{vmatrix} \mathbf{a} & \mathbf{b} \\ \mathbf{c} & \mathbf{d} \end{vmatrix} = \begin{vmatrix} 1 & 3 \\ 2 & 1 \end{vmatrix}$$



Counter-Clockwise - Positive Area **Clockwise - Negative Area**

06-17: **Determinant: Geometry**

- Compare determinant of a matrix to how matrix transforms objects
- Consider the transform matrix:

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix}$$

- What happens when we transform the unit cube, using this matrix?

06-18: **Cube Transformation**

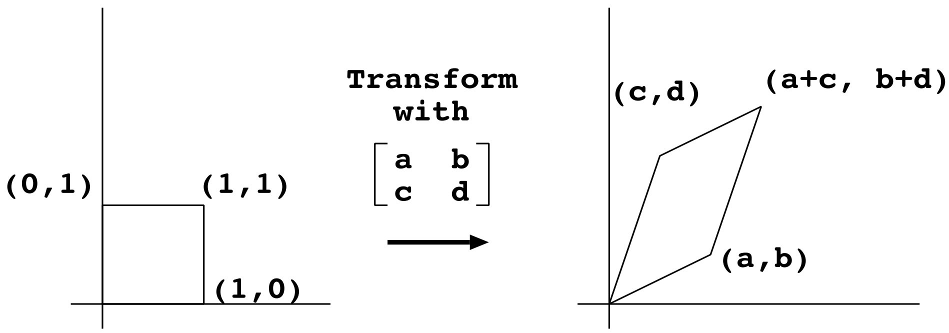
$$[\begin{array}{cc} 0 & 0 \end{array}]\left[\begin{array}{cc} a & b \\ c & d \end{array}\right] = [\begin{array}{cc} 0 & 0 \end{array}]$$

$$[\begin{array}{cc} 1 & 0 \end{array}]\left[\begin{array}{cc} a & b \\ c & d \end{array}\right] = [\begin{array}{cc} a & b \end{array}]$$

$$[\begin{array}{cc} 0 & 1 \end{array}]\left[\begin{array}{cc} a & b \\ c & d \end{array}\right] = [\begin{array}{cc} c & d \end{array}]$$

$$[\begin{array}{cc} 1 & 1 \end{array}]\left[\begin{array}{cc} a & b \\ c & d \end{array}\right] = [\begin{array}{cc} a+c & b+d \end{array}]$$

06-19: **Cube Transformation**



06-20: **Determinant as Scale**

- Determinant gives the volume of a unit square after transformation
  - Determinant gives the scaling factor for the transformation
  - Determinant $< 1 \Rightarrow$ "shrink" object
  - Determinant $= 1 \Rightarrow$ object size (area) unchanged
  - Determinant $> 1 \Rightarrow$ "grow" object

06-21: **Determinant as Scale**

- Sanity check:
  - Identity transform does not change an object – determinant should be 1

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

  - Matrix that scales by factor s:

$$\begin{bmatrix} s & 0 \\ 0 & 1 \end{bmatrix}$$

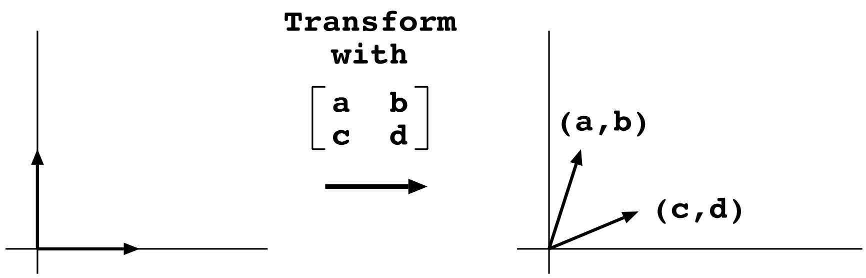
  This is just multiplying a column (or row!) by the scalar s – multiplies the value of the determinant by s

06-22: **Negative Determinant**

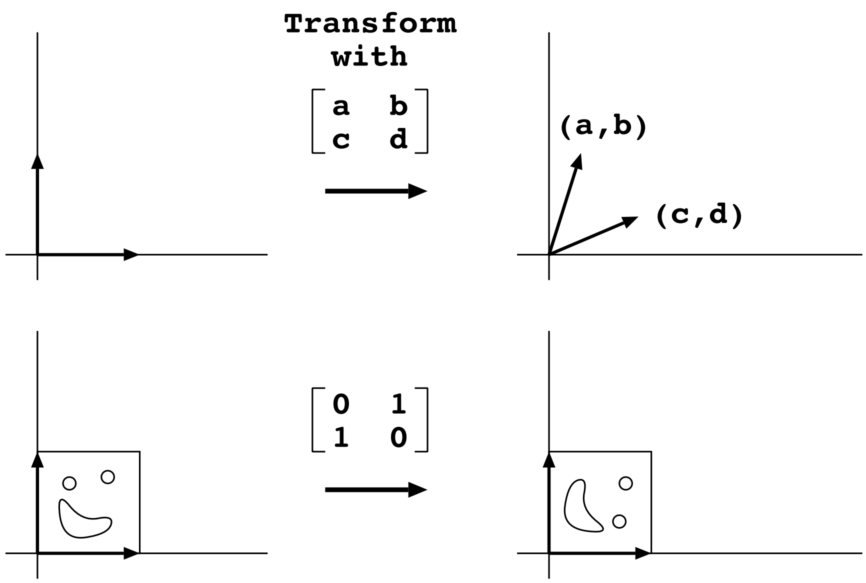
- Determinant gives *signed* area
- Pictures assume that (a, b) is clockwise of (c, d)

- What happens if (a, b) is *counterclockwise* of (c, d)?
- What do you know about the transformation?

06-23: **Negative Determinant**



06-24: **Negative Determinant**



06-25: **Negative Determinant**

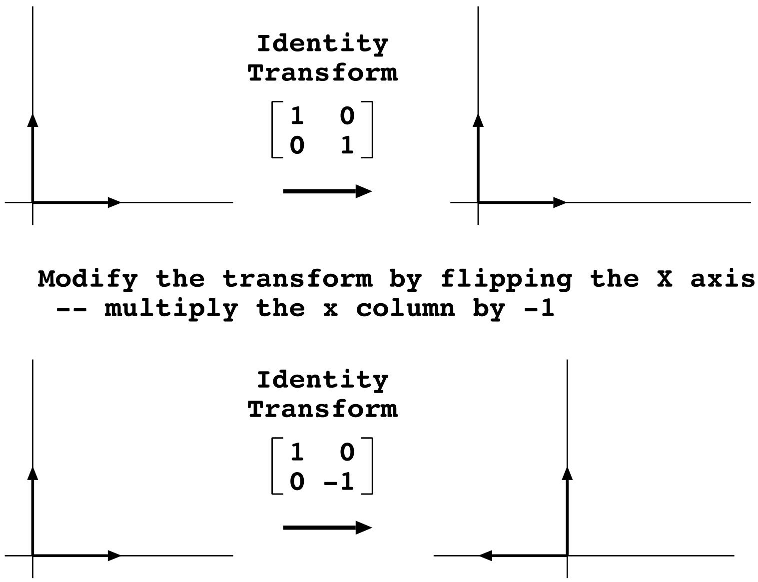
- If the determinant of a transformation matrix is negative
  - Transformation includes a reflection
- Sanity check:
  - Flip the basis vectors in a transformation matrix, cause a reflection
  - Swapping rows (or columns) in a determinant changes the sign

06-26: **Negative Determinant**

- If the determinant of a transformation matrix is negative
  - Transformation includes a reflection
- Sanity check II:
  - What happens to a transformation matrix when we flip a dimension?

- That is, multiply a column (assuming row vectors) by -1
- What does that do to the determinant?

06-27: **Negative Determinant**

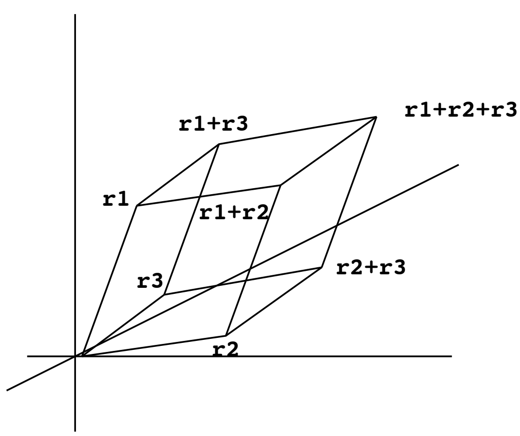


06-28: **Negative Determinant**

- Multiplying one column of the matrix flips that axis
- Multiplies the determinant by -1
  - Multiplying all elements of a row or column by k changes the value of the determinant by a factor of k

06-29: **Determinant Geom 3D**

- 3x3 determinants have the same properties as 2x2 determinants
- Determinant of a 3x3 matrix is the scale factor for how the volume of the transformed object changes
- -1 == Reflection, just like 2D case



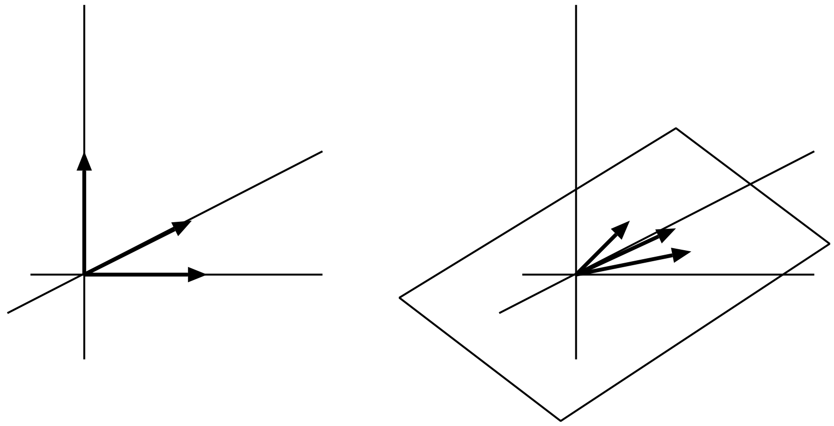
$$\begin{vmatrix} r1_x & r1_y & r1_z \\ r2_x & r2_y & r2_z \\ r3_x & r3_y & r3_z \end{vmatrix}$$

06-30: **Determinant Geom 3D**

06-31: **Zero Determinant**

- What does it mean (geometrically) when a 3x3 matrix has a zero determinant?
- What kind of a transformation is it?

Transformation Matrix with Zero Determinant



Basis vectors transformed to same plane

06-32: **Zero Determinant**

06-33: **Matrix Inverse**

- Given a square matrix M, the inverse M^{-1} is the matrix such that
  - $\mathbf{M}\mathbf{M}^{-1} = \mathbf{I}$
  - $\mathbf{M}^{-1}\mathbf{M} = \mathbf{I}$
- Since matrix multiplication is associative, for any vector $\mathbf{v}$:
  - $(\mathbf{v}\mathbf{M})\mathbf{M}^{-1} = \mathbf{v}$
- Matirx Inverse undoes the transformation

06-34: **Matrix Inverse**

- Do all square matrices have an inverse?

06-35: **Matrix Inverse**

- Do all square matrices have an inverse?
  - Consider:

$$\mathbf{M} = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}$$

  - What happens when we multiply $\mathbf{M}$ by a vector $\mathbf{v}$? Why can't we undo this operation?

06-36: **Singular**

- A matrix that has an inverse is *Non-Singular* or *Invertable*
- A matrix without an inverse is *Singlular* or *Non-Invertable*

- A matrix is singular if and only if it has a determinant of 0

06-37: **Calculating Inverse**

- To calculate the inverse, we will need cofactor matrix
- We've already seen cofactors (just not with that name), when calculating determinant

$$\begin{vmatrix} + & - & + \\ - & + & - \\ + & - & + \end{vmatrix}$$

$$\begin{vmatrix} a & \cancel{b} & \cancel{c} \\ \cancel{d} & e & f \\ \cancel{g} & h & i \end{vmatrix} \qquad \begin{vmatrix} \cancel{a} & b & \cancel{c} \\ d & \cancel{e} & f \\ g & \cancel{h} & i \end{vmatrix} \qquad \begin{vmatrix} \cancel{a} & \cancel{b} & c \\ d & e & \cancel{f} \\ g & h & \cancel{i} \end{vmatrix}$$

$$+\begin{vmatrix} e & f \\ h & i \end{vmatrix} \qquad -\begin{vmatrix} d & f \\ g & i \end{vmatrix} \qquad +\begin{vmatrix} d & e \\ g & h \end{vmatrix}$$

06-38: **Cofactors**

06-39: **Cofactors**

$$\begin{vmatrix} + & - & + \\ - & + & - \\ + & - & + \end{vmatrix}$$

$$\begin{vmatrix} \cancel{a} & b & c \\ d & \cancel{e} & \cancel{f} \\ \cancel{g} & h & i \end{vmatrix} \qquad \begin{vmatrix} a & \cancel{b} & c \\ \cancel{d} & e & \cancel{f} \\ g & \cancel{h} & i \end{vmatrix} \qquad \begin{vmatrix} a & b & \cancel{c} \\ \cancel{d} & \cancel{e} & f \\ g & h & \cancel{i} \end{vmatrix}$$

$$-\begin{vmatrix} b & c \\ h & i \end{vmatrix} \qquad +\begin{vmatrix} a & c \\ g & i \end{vmatrix} \qquad -\begin{vmatrix} a & b \\ g & h \end{vmatrix}$$

06-40: **Cofactor Matrix**

$$\begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}$$

Cofactor Matrix

$$\begin{bmatrix} \begin{vmatrix} e & f \\ h & i \end{vmatrix} & -\begin{vmatrix} d & f \\ g & i \end{vmatrix} & \begin{vmatrix} d & e \\ g & h \end{vmatrix} \\ -\begin{vmatrix} b & c \\ h & i \end{vmatrix} & \begin{vmatrix} a & c \\ g & i \end{vmatrix} & -\begin{vmatrix} a & b \\ g & h \end{vmatrix} \\ \begin{vmatrix} b & c \\ e & f \end{vmatrix} & -\begin{vmatrix} a & c \\ d & f \end{vmatrix} & \begin{vmatrix} a & b \\ d & e \end{vmatrix} \end{bmatrix}$$

06-41: **Calculating Inverse**

- Adjoint of a matrix $\mathbf{M}$, $adj(\mathbf{M})$ is the traspose of the cofactor matrix

- The inverse of a matrix is the adjoint divided by the determinant
  - $\mathbf{M}^{-1} = \frac{adj(\mathbf{M})}{|\mathbf{M}|}$
- (can see how a matrix a determinant of 0 would have a hard time having an inverse)
- Other ways of computing inverses (i.e. Gaussian elimination)
  - Fewer arithmetic operations
  - Algoritmns require branches (expensive!)
  - Vector hardware makes adjoint method fast

06-42: **Inverse Example** First, Calculate determinant

$$\begin{bmatrix} 1 & 2 & 1 \\ 2 & 2 & 1 \\ 1 & 1 & 2 \end{bmatrix}$$

$$\begin{vmatrix} 1 & 2 & 1 \\ 2 & 2 & 1 \\ 1 & 1 & 2 \end{vmatrix} = 1\begin{vmatrix} 2 & 1 \\ 1 & 2 \end{vmatrix} - 2\begin{vmatrix} 2 & 1 \\ 1 & 2 \end{vmatrix} + 1\begin{vmatrix} 2 & 2 \\ 1 & 1 \end{vmatrix} = -3$$

06-43: **Inverse Example** Next, calculate cofactor matrix

$$\begin{bmatrix} 1 & 2 & 1 \\ 2 & 2 & 1 \\ 1 & 1 & 2 \end{bmatrix}$$

$$\begin{bmatrix} \begin{vmatrix} 2 & 1 \\ 1 & 2 \end{vmatrix} & -\begin{vmatrix} 2 & 1 \\ 1 & 2 \end{vmatrix} & \begin{vmatrix} 2 & 2 \\ 1 & 1 \end{vmatrix} \\ -\begin{vmatrix} 2 & 1 \\ 1 & 2 \end{vmatrix} & \begin{vmatrix} 1 & 1 \\ 1 & 2 \end{vmatrix} & -\begin{vmatrix} 1 & 2 \\ 1 & 1 \end{vmatrix} \\ \begin{vmatrix} 2 & 1 \\ 2 & 1 \end{vmatrix} & -\begin{vmatrix} 1 & 1 \\ 2 & 1 \end{vmatrix} & \begin{vmatrix} 1 & 2 \\ 2 & 2 \end{vmatrix} \end{bmatrix}$$

06-44: **Inverse Example** Next, calculate cofactor matrix

$$\begin{bmatrix} 1 & 2 & 1 \\ 2 & 2 & 1 \\ 1 & 1 & 2 \end{bmatrix}$$

Cofactor matrix:

$$\begin{bmatrix} 3 & -3 & 0 \\ -3 & 1 & 1 \\ 0 & 1 & -2 \end{bmatrix}$$

06-45: **Inverse Example** Transpose the cofactor array to get the adjoint (in this example the adjoint is equal to its transpose, but that doesn't always happen)

$$\begin{bmatrix} 1 & 2 & 1 \\ 2 & 2 & 1 \\ 1 & 1 & 2 \end{bmatrix}$$

Adjoint:

$$\begin{bmatrix} 3 & -3 & 0 \\ -3 & 1 & 1 \\ 0 & 1 & -2 \end{bmatrix}$$

06-46: **Inverse Example** Finally, divide adjoint by the determinant to get the inverse:

$$\begin{bmatrix} 1 & 2 & 1 \\ 2 & 2 & 1 \\ 1 & 1 & 2 \end{bmatrix}$$

Inverse:

$$\begin{bmatrix} -1 & 1 & 0 \\ 1 & -\frac{1}{3} & -\frac{1}{3} \\ 0 & -\frac{1}{3} & \frac{2}{3} \end{bmatrix}$$

06-47: **Inverse Example** Sanity check

$$\begin{bmatrix} 1 & 2 & 1 \\ 2 & 2 & 1 \\ 1 & 1 & 2 \end{bmatrix} \begin{bmatrix} -1 & 1 & 0 \\ 1 & -\frac{1}{3} & -\frac{1}{3} \\ 0 & -\frac{1}{3} & \frac{2}{3} \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

06-48: **Orthogonal Matrices**

- A matrix $\mathbf{M}$ is orthogonal if:
  - $\mathbf{M}\mathbf{M}^T = \mathbf{I}$
  - $\mathbf{M}^T = \mathbf{M}^{-1}$
- Orthogonal matrices are handy, because they are easy to invert
- Is there a geometric interpretation of orthogonality?

06-49: **Orthogonal Matrices**

$$\begin{aligned} \mathbf{M}\mathbf{M}^T &= \mathbf{I} \\ \begin{bmatrix} m_{11} & m_{12} & m_{13} \\ m_{21} & m_{22} & m_{23} \\ m_{31} & m_{32} & m_{33} \end{bmatrix} \begin{bmatrix} m_{11} & m_{21} & m_{31} \\ m_{12} & m_{22} & m_{32} \\ m_{13} & m_{23} & m_{33} \end{bmatrix} &= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{bmatrix} \end{aligned}$$

Do all the multiplications ...

06-50: **Orthogonal Matrices**

$$\begin{aligned} m_{11}m_{11} + m_{12}m_{12} + m_{13}m_{13} &= 1 \\ m_{11}m_{21} + m_{12}m_{22} + m_{13}m_{23} &= 0 \\ m_{11}m_{31} + m_{12}m_{32} + m_{13}m_{33} &= 0 \\ m_{21}m_{11} + m_{22}m_{12} + m_{23}m_{13} &= 0 \\ m_{21}m_{21} + m_{22}m_{22} + m_{23}m_{23} &= 1 \\ m_{21}m_{31} + m_{22}m_{32} + m_{23}m_{33} &= 0 \\ m_{31}m_{11} + m_{32}m_{12} + m_{33}m_{13} &= 0 \\ m_{31}m_{21} + m_{32}m_{22} + m_{33}m_{23} &= 0 \\ m_{31}m_{31} + m_{32}m_{32} + m_{33}m_{33} &= 1 \end{aligned}$$

- Hmmm... that doesn't seem to help much

06-51: **Orthogonal Matrices**

- Recall that rows of matrix are basis after rotation
  - $\mathbf{v}_x = [m_{11}, m_{12}, m_{13}]$
  - $\mathbf{v}_y = [m_{21}, m_{22}, m_{23}]$
  - $\mathbf{v}_z = [m_{31}, m_{32}, m_{33}]$
- Let's rewrite the previous equations in terms of $\mathbf{v}_x$, $\mathbf{v}_y$, and $\mathbf{v}_z$ ...

06-52: **Orthogonal Matrices**

$$\begin{aligned}
m_{11}m_{11} + m_{12}m_{12} + m_{13}m_{13} &= 1 \quad \mathbf{v}_x \cdot \mathbf{v}_x = 1 \\
m_{11}m_{21} + m_{12}m_{22} + m_{13}m_{23} &= 0 \quad \mathbf{v}_x \cdot \mathbf{v}_y = 0 \\
m_{11}m_{31} + m_{12}m_{32} + m_{13}m_{33} &= 0 \quad \mathbf{v}_x \cdot \mathbf{v}_z = 0 \\
m_{21}m_{11} + m_{22}m_{12} + m_{23}m_{13} &= 0 \quad \mathbf{v}_y \cdot \mathbf{v}_x = 0 \\
m_{21}m_{21} + m_{22}m_{22} + m_{23}m_{23} &= 1 \quad \mathbf{v}_y \cdot \mathbf{v}_y = 1 \\
m_{21}m_{31} + m_{22}m_{32} + m_{23}m_{33} &= 0 \quad \mathbf{v}_y \cdot \mathbf{v}_z = 0 \\
m_{31}m_{11} + m_{32}m_{12} + m_{33}m_{13} &= 0 \quad \mathbf{v}_z \cdot \mathbf{v}_x = 0 \\
m_{31}m_{21} + m_{32}m_{22} + m_{33}m_{23} &= 0 \quad \mathbf{v}_z \cdot \mathbf{v}_y = 0 \\
m_{31}m_{31} + m_{32}m_{32} + m_{33}m_{33} &= 1 \quad \mathbf{v}_z \cdot \mathbf{v}_z = 1
\end{aligned}$$

06-53: **Orthogonal Matrices**

- What does it mean if $\mathbf{u} \cdot \mathbf{v} = 0$?
  - (assuming both $\mathbf{u}$ and $\mathbf{v}$ are non-zero)
- What does it mean if $\mathbf{v} \cdot \mathbf{v} = 1$?

06-54: **Orthogonal Matrices**

- What does it mean if $\mathbf{u} \cdot \mathbf{v} = 0$?
  - (assuming both $\mathbf{u}$ and $\mathbf{v}$ are non-zero)
  - $\mathbf{u}$ and $\mathbf{v}$ are perpendicular to each other (orthogonal)
- What does it mean if $\mathbf{v} \cdot \mathbf{v} = 1$?
  - $||\mathbf{v}|| = 1$
- So, transformed basis vectors must be mutually perpendicular unit vectors

06-55: **Orthogonal Matrices**

- If a transformation matrix is orthogonal,
  - Transformed basis vectors are mutually perpendicular unit vectors
- What kind of transformations are done by orthogonal matrices?

06-56: **Orthogonal Matrices**

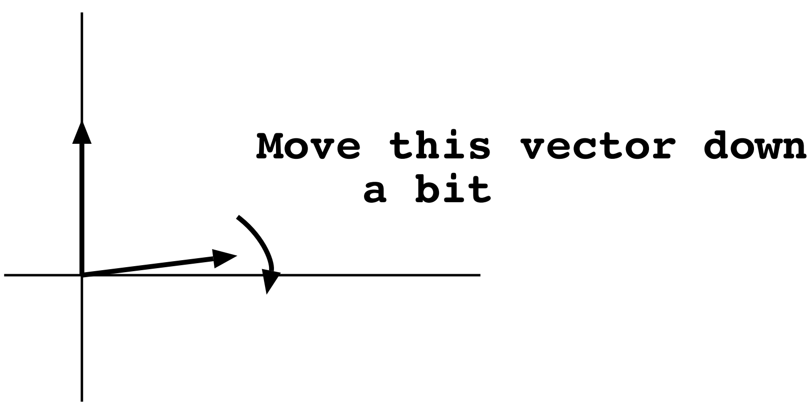
- If a transformation matrix is orthogonal,
  - Transformed basis vectors are mutually perpendicular unit vectors
- What kind of transformations are done by orthogonal matrices?
  - Rotations & Reflections

06-57: **Orthogonalizing a Matrix**

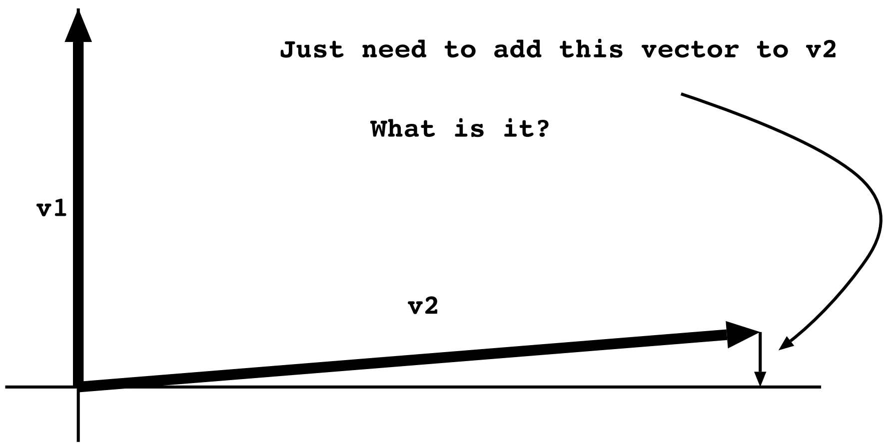
- It is possible to have a matrix that *should* be orthogonal that is *not quite* orthogonal
  - Bad Data
  - Accumulated floating point error (matrix creep)
- If a matrix is just slightly non-orthogonal, we can modify it to be orthogonal

06-58: **Orthogonalizing a Matrix**

Not quite orthogonal



06-59: **Orthogonalizing a Matrix**



06-60: **Orthogonalizing a Matrix**

- Given two vectors $\mathbf{v_1}$ and $\mathbf{v_2}$ that are *nearly* orthogonal, we subtract from $\mathbf{v_2}$ the component of $\mathbf{v_2}$ that is parallel to $\mathbf{v_1}$

$$\begin{aligned}\mathbf{v_2} &= \mathbf{v_2} - \frac{\mathbf{v_1}\cdot\mathbf{v_2}}{||\mathbf{v_1}||^2}\mathbf{v_1} \\ &= \mathbf{v_2} - \frac{\mathbf{v_1}\cdot\mathbf{v_2}}{\mathbf{v_1}\cdot\mathbf{v_1}}\mathbf{v_1}\end{aligned}$$

06-61: **Orthogonalizing a Matrix**

- We can easily extend this to 3 dimensions:
  - Leave the first vector alone
  - Tweak the second vector to be perpendicular to the first vector
  - Tweak the third vector to be perpendicular to first two vectors

06-62: **Orthogonalizing a Matrix**

- Given a *nearly* ortrhogonal matrix with rows r_1, r_2, and r_3:

$$\begin{aligned}\mathbf{r'_1} &= \mathbf{r_1} \\ \mathbf{r'_2} &= \mathbf{r_2} - \frac{\mathbf{r_2}\cdot\mathbf{r'_1}}{\mathbf{r'_1}\cdot\mathbf{r'_1}}\mathbf{r'_1} \\ \mathbf{r'_3} &= \mathbf{r_3} - \frac{\mathbf{r_3}\cdot\mathbf{r'_1}}{\mathbf{r'_1}\cdot\mathbf{r'_1}}\mathbf{r'_1} - \frac{\mathbf{r_3}\cdot\mathbf{r'_2}}{\mathbf{r'_2}\cdot\mathbf{r'_2}}\mathbf{r'_2}\end{aligned}$$

- Need to normalize $\mathbf{r_1}$, $\mathbf{r_2}$, $\mathbf{r_3}$
- If we normalize $\mathbf{r'_1}$ before calculating $\mathbf{r'_2}$, then $\mathbf{r'_1}\cdot\mathbf{r'_1} = 1$, and we can remove a division

06-63: **Orthogonalizing a Matrix**

- The problem with orthogonalizing a matrix this way is that there is a bias
  - First row never changes
  - Third row changes the most
- What if we don't want a bias?

06-64: **Orthogonalizing a Matrix**

- The problem with orthogonalizing a matrix this way is that there is a bias
  - First row never changes
  - Third row changes the most
- What if we don't want a bias?
  - Change each vector a little bit in the correct direction
  - Repeat until you get close enough
  - Then run the "standard" method

06-65: **Orthogonalizing a Matrix**

$$\begin{aligned}
\mathbf{r}_1' &= \mathbf{r}_1 - k\frac{\mathbf{r}_1 \cdot \mathbf{r}_2}{\mathbf{r}_2 \cdot \mathbf{r}_2}\mathbf{r}_2 - k\frac{\mathbf{r}_1 \cdot \mathbf{r}_3}{\mathbf{r}_3 \cdot \mathbf{r}_3}\mathbf{r}_3 \\
\mathbf{r}_2' &= \mathbf{r}_2 - k\frac{\mathbf{r}_2 \cdot \mathbf{r}_1}{\mathbf{r}_1 \cdot \mathbf{r}_1}\mathbf{r}_1 - k\frac{\mathbf{r}_2 \cdot \mathbf{r}_3}{\mathbf{r}_3 \cdot \mathbf{r}_3}\mathbf{r}_3 \\
\mathbf{r}_3' &= \mathbf{r}_3 - k\frac{\mathbf{r}_3 \cdot \mathbf{r}_1}{\mathbf{r}_1 \cdot \mathbf{r}_1}\mathbf{r}_1 - k\frac{\mathbf{r}_3 \cdot \mathbf{r}_2}{\mathbf{r}_2 \cdot \mathbf{r}_2}\mathbf{r}_2
\end{aligned}$$

- Do several iterations (smallish k)
- Not guaranteed to get exact – run standard method when done
